Several Mexican and U.S. institutions collaborated to develop this simulation-based training program.

The authors would like to thank the following Mexican institutions for their financial and logistical support in the piloting of this program: the National Institute of Public Health (INSP), the National Institute for Women (INMUJERES), the National Center for Gender Equity and Reproductive Health, the State Council on Women and Social Welfare of the State of Mexico, and the Secretary for the Development and Empowerment of Women (SEDEM) in Chiapas. Thank you to our collaborating U.S. institutions including: the University of Utah College of Nursing, Department of Nurse Midwifery and Women’s Health, the Simulation Learning Center, and the University Hospital; the University of Washington Department of Obstetrics and Gynecology and the Department of Global Health; and the University of Maryland School of Medicine Department of Obstetrics, Gynecology and Reproductive Sciences.

We could not have developed this program and its manuals without the support of our colleagues, family and friends. Specifically, we would like to thank Dr. Leslie Cragin and Mike Rizk for their support of the PartoPants™; Janet Fisher for her research on simulation trainings; Betty Cohen for her support in the development of the interactive activities; Derek Hackmann for his help in the design of the algorithms; Francesca Holme for logistical and editorial support; Whitney Powell and Lauren Vose for translation support; and finally Jimena Fritz and Fatima Estrada and the whole PRONTO Mexico team for their support in the original development of PRONTO Mexico. We also thank the Bill and Melinda Gates Foundation for their ongoing support of PRONTO activities in Latin America.
Introduction

Welcome back! This is the participant manual for PRONTO Module II. A few months ago, you participated in the Module I PRONTO training. Module II will reinforce the topics covered in Module I: teamwork, postpartum hemorrhage, and neonatal resuscitation. Module II also introduces the topics of shoulder dystocia and pre-eclampsia/eclampsia. As in PRONTO Module I, your will actively participate in all segments of the program including interactive activities and simulations.

Let's get started!
Acronyms

MVA  Manual Vacuum Aspiration
PPH  Postpartum Hemorrhage
AMTSL  Active Management of the Third Stage of Labor
EBM  Evidence-Based Medicine
MDGs  Millennium Development Goals
DCC  Delayed Cord Clamping
PRONTO  The Program for Simulation and Team Training for Obstetric and Neonatal Emergencies
NR  Neonatal Resuscitation
SBAR  Situation/Background/Assessment/Recommendation (Communication Technique)
Team STEPPS  U.S. Government teamwork training curriculum

1.2 Group Rules

Group rules help create a safe environment within which team members can achieve their goals. Please take a moment to reflect on what rules will make you feel comfortable participating. Remember that:

1. This training should be a safe space for improving skills for working together as a team.
2. “What happens in simulation stays in simulation.” This allows people to grow and learn as a team, without having to consider repercussions. We encourage you to share your learning and insights with others. However, information about individual participant behavior or response is to stay within the group and not be shared. This is the concept of confidentiality.

1.3 Ground Rules for Simulations

For the PRONTO training to be successful, we ask that you:

1. Suspend your disbelief.
2. Have an open mind.
3. Promise to maintain confidentiality.
4. Allow mistakes to be made in order to learn from them.
5. Be open with the other participants.
6. Work as a team without worrying about personal ego.
### 10 Key Behavioral Skills

1. Know your environment.
2. Anticipate and plan for problems.
3. Assume a leadership role.
4. Communicate effectively with your team, the patient, and their family members.
5. Distribute workload and delegate responsibility optimally.
6. Allocate attention wisely.
7. Utilize all available information.
8. Utilize all available resources.
9. Recognize limitations and call for help early enough.
10. Maintain professional behavior.

Stanford CAPE Center, Stanford University, 2008
1.5 Simulation Notes

Use the space below to take notes during the simulation and debrief. This will help you gather your thoughts for the debrief and also help you come back, at a later date, to the information that you learned in the simulations.

Appendix 1: Active Management of the Third Stage of Labor (AMTSL) for All Women

1. **Administration of a uterotonic drug** (ten international units (IU) of oxytocin administered by intramuscular (IM) injection is the uterotonic of choice).

   Before performing AMTSL, the provider will gently palpate the woman’s abdomen to rule out the presence of another baby. At this point, the provider will NOT massage the uterus.

   If there is not another baby, the provider will begin the procedure by giving the woman a uterotonic drug (oxytocin 10 IU IM, Syntometrine 1 mL IM, ergometrine 0.2 mg IM, or misoprostol 600 mcg orally). This should be done within one minute of childbirth.

2. **Controlled cord traction (CCT):** Controlled traction on the cord during a contraction combined with counter-traction upward on the uterus with the provider’s hand placed immediately above the symphysis pubis. CCT facilitates expulsion of the placenta once it has separated from the uterine wall.

   **Countertraction (counter pressure):** The action of lifting or elevating the uterus toward the mother’s head during CCT to help prevent uterine inversion.

3. **Uterine massage:** An action used after the delivery of the placenta in which the provider places one hand on top of the uterus to rub or knead the uterus until it is firm. Sometimes blood and clots are expelled during uterine massage.
Appendix 2: Active Management of the Third Stage of Labor (AMTSL) With Delayed Cord Clamping

1: Dry the baby, assess the baby's breathing and perform resuscitation if needed, and place the baby in skin-to-skin contact with the mother.

2: Administer a uterotonic (the uterotonic of choice is oxytocin 10 IU [IU]) immediately after birth of the baby, and after ruling out the presence of another baby.

3: Clamp and cut the cord after cord pulsations have ceased or approximately 2-3 minutes after birth of the baby, whichever comes first.

4: Place the infant directly on the mother's chest, prone, with the newborn's skin touching the mother's skin. Cover the baby's head with a cap or cloth.

5: Perform controlled cord traction while, at the same time, supporting the uterus by applying external pressure on the uterus in an upward direction towards the woman's head.

6: Massage the uterus immediately after delivery of the placenta and membranes until it is firm.

During recovery, assist the woman to breastfeed if this is her choice, monitor the newborn and woman closely, palpate the uterus through the abdomen every 15 minutes for two hours to make sure it is firm and monitor the amount of vaginal bleeding. Provide PMTCT care as needed.

...at every birth, by every skilled provider.
Appendix 3: Guide for Neonatal Resuscitation

Initial Evaluation
- Assess for risk factors
  - Is the baby full term?
  - Is the amniotic fluid clear?
- Assess if newborn is vigorous
  - Is the baby breathing or crying?
  - Does the baby have good tone?
  - Is the baby’s heart rate >100?

Provide Routine Care
- Keep warm
- Clear airway
- Dry

Initial Resuscitation
- 30 Seconds
  - Place under a source of radiant heat
  - Open airway with suction and positioning
  - Dry and stimulate

Evaluation
- Respiratory Effort, Heart Rate (HR), Color

Breathing/Crying, HR >100, Pink
- Evaluate periodically and provide routine care

Apnea or HR <100 or Central Cyanosis
- Positive Pressure Ventilation (PPV)
  - 30 Seconds
  - Using a bag and mask at rate of 40-60 bpm
  - “Breathe-two-three”

Evaluation
- Respiratory Effort, Heart Rate (HR), Color

Breathing/Crying, HR >100, Pink
- Gradually discontinue PPV

HR <60
- Chest Compressions (CC)
  - 30 Seconds
  - PPV + CC at 90 compressions/min
  - “And-ONE-and-TWO-and-THREE- and-Breathe”

Evaluation
- Respiratory Effort, Heart Rate (HR), Color

Breathing/Crying, HR >100, Pink
- HR > 60 and improving

HR <60
- Administer Medications
  - Follow Appendix: Medications for Neonatal Resuscitation
## Appendix 4: Communication Concepts

**SBAR**
SBAR is a technique for rapidly communicating critical patient information. Use the SBAR anytime a new member of the team enters the room, or when the patient situation changes. SBAR stands for:

- **Situation**: What is happening to the patient?
  “*Mrs. Kwamboka in bed 2 is bleeding and feels dizzy.*”
- **Background**: The clinical context or relevant medical history of the patient.
  “*The patient is a 32-year-old Gravida 4 Para 3003, two hours status post a vaginal delivery complicated by a second degree laceration. She does not have any other problems.*”
- **Assessment**: What do you think is the problem?
  “*I think her bleeding is caused by uterine atony.*”
- **Recommendation/Request**: What can be done to intervene?
  “*I believe this patient needs to be evaluated right now. Are you available to come evaluate the patient?*”

Now practice SBAR with your neighbor.

---

**Call-Out**
Call-Out is a quick way of communicating critical information. It enables the whole team to know the severity of the situation quickly and to begin to allocate attention appropriately. When the urgency of the situation is verbalized, everyone knows where the case is headed. It is also a way to keep a team apprised of key clinical information. Examples of call-out communication include:

- “*The patient is bleeding!*”
- “*The baby has been born!*”
- “*The baby is not crying!*”
- “*There is meconium in the amniotic fluid!*”

---

**Check-Back**
Unlike open-air orders, check-back ensures that the message reaches the appropriate person and that it is appropriately responded to. It is a strategy used to communicate critically important information, and assigns important responsibilities to a specific individual.

Using check-back to close the loop of communication ensures that the information expressed is understood by the person receiving it:

- The transmitter sends the message.
- The receiver accepts the message and provides feedback.
- The transmitter verifies that the message was received correctly.

**For example:**
Doctor: “*Administer 10 units of oxytocin IM.*”
Nurse: “*10 units of oxytocin IM.*”
Doctor: “*Correct.*”
**Think Outloud**

Think outloud means anyone on the team can verbalize his/her actions. Say outloud what you are doing, feeling, or seeing in order to:

- Inform all members of the team simultaneously of the state of the emergency.
- Help team members to anticipate the next steps.

For example: “The bleeding continues and her blood loss is 1000 ml. I’m going to perform bimanual compression.... Her uterus does not have any clots and is firming up.”

---

**The Two-Challenge Rule**

The Two-Challenge Rule is a communication tool adapted from the aviation industry and tested in medical centers by the program Team STEPPS. It is a good way to resolve conflicts and maintain patient safety. The Two-Challenge Rule states that if a subordinate detects an error or problem that could lead to a dangerous situation, he/she can challenge authority, repeating his/her concern two times. If the superior does not respond to the call on the second occasion, the subordinate can automatically request another person’s help in resolving the problem. This allows subordinates to protect the patient without fear of reproach.

It is your responsibility to firmly express your concern at least two times to make sure you have been heard. If the person still does not acknowledge your point or think twice about the order, you can speak more firmly. Say “I’m worried and I’m concerned. This is a patient safety issue.” If you are still ignored, you may go to a supervisor or superior in the chain-of-command.

If you are the leader in the situation and you hear your team member repeat his/her concern two times, you should stop and re-think your order or course of action, because it is a patient safety matter. This allows any member of the team to “break the chain” if he/she suspects or discovers any threat to patient safety.

**For example:**

Doctor: “Administer 0.2 mg of ergonovine IM.”

Nurse: “Are you sure, Doctor? This woman is hypertensive and I believe you shouldn’t give ergonovine to a hypertensive woman.”

If the superior does not respond, or if he/she asks that you proceed with the order, you ask for clarification again.

Doctor: “I am the one who gives the orders, and I’m ordering 0.2 mg of ergonovine immediately! Can’t you see that she is bleeding?”

Nurse: “Yes, Doctor, but she is not bleeding heavily and I’m worried about giving her a medication that could be dangerous for her. I can obtain more oxytocin if you wish.”

If the request is still denied, you can choose to go to a superior to contest the issue.
Questions for Immediate Debriefing:

___ Was our communication clear?
___ Were our roles and responsibilities understood?
___ Did we maintain situation awareness?
___ Did we distribute the work equally?
___ Did we call for help soon enough? Did help arrive?
___ Did we make any errors? Did we prevent any errors?
___ Did we have all the resources we needed?
___ What went well, what could have gone better, and what should we improve?
Basic Emergency Response

☐ Ask for help
☐ Check the airway/ Check breathing
☐ Administer oxygen (mask)
☐ Obtain IV Access with a #14 or #16 catheter
☐ Initiate and replace volume (crystalloids – 3 to 1)

*Caution in women with pre-eclampsia, anemia, cardiac disease

☐ Watch her vital signs (BP, temp, respirations, and pulse)
☐ Empty the bladder with an indwelling catheter: measure output
☐ Consider the need for a blood transfusion

☐ Send labs ➔

- CBC
- PT & PTT
- Fibrinogen
- Platelets
- Blood type & screen

Goals
- Hemoglobin between 7-10 gr/dL
- Platelets >100,000
- INR <1.5
- Fibrinogen >100m gr/dL
- Mean arterial pressure > 65mm Hg
- Urine output >30ml / hour

☐ Maintain body temperature

*If she is bleeding postpartum, initiate the Uterine Atony Algorithm
Appendix 6: Management of Postpartum Hemorrhage

Obstetric Hemorrhage

≥ 500 ml

Institute Basic Emergency Care

See Algorithm: Basic Emergency Care

Diagnose the Problem

1st Trimester
- Abortion
- Ectopic
- Molar

70%

Tone
- Uterine atony

2nd and 3rd Trimester
- Placenta Previa
- Uterine Rupture
- Placental Abruption

20%

Trauma
- Lacerations
- Uterine Rupture

10%

Tissue
- Retained placental parts

1%

Thrombin
- Coagulation Alterations

Treat the Cause

- Massage
- Uterotonics
- Compression
- Surgical

- Repair
- Surgical
- Transfer for surgical intervention

- Management of retained placenta
- Prophylactic Antibiotics

- Volume replacement
- Blood and blood product Transfusion
- Stabilize and Transfer

Uterine Atony Algorithm
Appendix 7: Uterine Atony

Uterine Atony

Institute Basic Emergency Care

Uterine Massage

See Algorithm: Basic Emergency Care

Uterotonics

Oxytocin (20-30 IU IV or 10 IU IM – max 60 IU)

Ergonovine maleate (0.2 mg IM – every 15 mins, max 3 doses)

Misoprostol (600 mcg SL or 800 mcg Rectal)

Carboprost (0.25 mg IM – every 20 mins, max 5 doses)

Non-Surgical Uterine Compression

- Bimanual Compression
- Compression with Foley/Condom/Glove (150-200 cc NS)

Surgical - Uterine Compression

- B-Lynch suture
- Artery Ligation (Uterine or Hypogastric)
- Uterine artery embolization

Transfer and/or Hysterectomy
## Appendix 8: Management of Hypovolemic Shock

<table>
<thead>

## Appendix 9: Uterotonic Medications

<table>
<thead>
<tr>
<th>Medication</th>
<th>Route/Dose</th>
<th>Frequency</th>
<th>Observations</th>
<th>Requirements for storage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oxytocin</td>
<td>IV: 10-40 units in 1 liter of Physiologic Solution or Normal Saline IM: 10 units</td>
<td>Continuous 60 units maximum</td>
<td>Effective within 2-3 minutes Can be used in all women Caution with using oxytocin with excessive amounts of IV fluids</td>
<td>Store between 15°C and 25°C Storage in the delivery room at room temperature (30°C) over a year’s time leads to a 14% decrease in efficacy Not destabilized by light</td>
</tr>
<tr>
<td>Carboprost</td>
<td>IM: 0.25 mg</td>
<td>Every 20 minutes 5 dose maximum</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ergonovine maleate</td>
<td>IM: 0.2 mg</td>
<td>Every 20-30 minutes 3 dose maximum</td>
<td>Effective within 2-5 minutes The effect lasts 2-4 hours Contraindicated in hypertension, eclampsia and migraine-sufferers</td>
<td>Store between 2°C and 8°C Protect from light and from freezing Requires strict conditions for storage and handling</td>
</tr>
<tr>
<td>Misoprostol</td>
<td>Sublingual: 600 mcg Rectal: 800-1000 mcg</td>
<td>Once</td>
<td>Effective within 9-12 minutes Side effects: shivering, nausea, fever, diarrhea</td>
<td>Keep in at room temperature in a closed container</td>
</tr>
</tbody>
</table>

**Appendix 10: Instant coagulation test**

<table>
<thead>
<tr>
<th>Instant coagulation test</th>
</tr>
</thead>
<tbody>
<tr>
<td>Place 2 ml of venous blood in a clean 10 mm test tube.</td>
</tr>
<tr>
<td>Hold the tube in a closed fist (+37°C).</td>
</tr>
<tr>
<td>After more than four minutes, turn the tube to the side to see if there are any clots that have formed.</td>
</tr>
<tr>
<td>Then check every minute until you can turn the tube upside down without the blood dripping down.</td>
</tr>
</tbody>
</table>

The absence of clot formation or a soft clot beyond 7 min indicates COAGULOPATHY.

Appendix 11: Assigning APGAR

APGAR

Apgar is a method used to evaluate the baby after birth to determine the degree to which it has adapted to the extrauterine environment.

The evaluation is done at the 1st and 5th minute of life. If the APGAR at the 5th minute of life is less than 7, you should continue to evaluate the baby every five minutes until you get to 7.

Modified from the American Academy of Pediatrics. NRP Trainer Guide. 2009
Appendix 13: Manual Vacuum Aspiration

Steps for Performing Manual Vacuum Aspiration (MVA) Using the Ipas MVA Plus® and Ipas EasyGrip® Cannulae

Step One: Prepare Instruments
- Position the plunger all the way inside the cylinder.
- Have collar stop in place with tabs in the cylinder holes.
- Push valve buttons down and forward until they lock (1).
- Pull plunger back until arms snap outward and catch on cylinder base (2).

Step Two: Prepare the Patient
- Ask the woman to empty her bladder.
- Conduct a bimanual exam to confirm uterine size and position.
- Insert speculum and conduct speculum exam to confirm findings of clinical assessment.

Step Three: Perform Cervical Antiseptic Prep
- Follow no-touch technique – no instrument that enters the uterus can contact contaminated surfaces before insertion through the cervix.
- Use antiseptic-soaked sponge to clean cervical os.
- Start at os and spiral outward without retraction areas.
- Continue until os has been completely covered by antiseptic.

Step Four: Perform Paracervical Block
- Paracervical block is recommended when mechanical dilatation is required with MVA.
- Using local protocols, administer paracervical block and place tenaculum.
- Use lowest anesthetic dose possible to avoid toxicity – for example, if using lidocaine, the recommended dose is less than 200mg/person.

Step Five: Dilate Cervix
- If cervix is insufficiently dilated, use mechanical dilators or progressively larger cannulae to dilate.
- Dilate cervix to allow a cannula approximate to the uterine size to fit snugly through the os.

Step Six: Insert Cannula
- While applying traction to tenaculum, insert cannula through the cervix, just past the os and into the uterine cavity or until it touches the fundus, and then withdraw it slightly.
- Do not insert the cannula forcefully.

Step Seven: Suction Uterine Contents
- Attach the prepared aspirator to the cannula.
- Release the vacuum by pressing the buttons.
- Evacuate the contents of the uterus by gently and slowly rotating the cannula 180° in each direction, using an in-and-out motion.
- When finished, depress the buttons, detach cannula or withdraw.

Signs that indicate the uterus is empty:
- Red or pink foam without tissue is seen passing through the cannula.
- A gritty sensation is felt as the cannula passes over the surface of the evacuated uterus.
- The uterus contracts around or grips the cannula.
- The patient complains of cramping or pain, indicating that the uterus is contracting.

Step Eight: Inspect Tissue
- Empty the contents of the aspirator into a container.
- Inspect tissue for products of conception, complete evacuation and meter pregnancy.
- If inspection is inconclusive, strain material, float in water or vinegar and view with a light from beneath.

Step Nine: Perform Any Concurrent Procedures
- When procedure is complete, proceed with contraception or other procedures, such as IUD insertion or cervical tear repair.

Step Ten: Process Instruments
- When procedure is complete, immediately process or discard all instruments, including the aspirator and cannulae, according to local protocols.
Appendix 14: Shoulder Dystocia

Shoulder Dystocia

Stay Calm
Call Out/Call for Help
Call the pediatrician/neonatalogist

Ask the mother NOT to push
Move the mother to the edge of the bed

Avoid applying traction on the baby’s head
NO fundal pressure at any time
Do not attempt any maneuver for more than 30 seconds

Hyperflexion of the hips (McRoberts maneuver) and
Suprapubic Pressure (Manzzanti maneuver)

Fetal Rotation Maneuvers:
Rubin and Modified Rubin
Wood’s Screw

Jaquemier Maneuver:
Delivery of the posterior arm

Gaskin Maneuver:
Hands and knees position.

If the baby is still not born, try all maneuvers again

Maneuvers of last resort:
• Fracture the clavicle (inward pressure)
• Zavanelli Maneuver: Replacement of the fetal head, by reversing the mechanisms of birth, then immediate cesarean section. Should only be attempted in extreme cases.
Appendix 15: Severe Preeclampsia

Severe Preeclampsia

Diagnose

Admit and Monitor

Goals

1. Prevent Seizures
   - Magnesium Sulfate
     - Loading: 4 g IV (4 ampules) in 500 ml physiologic solution over 15 minutes.
     - Maintenance dose: Place 10 g (10 ampules) in 500 ml physiologic solution administer at 100 ml/hr, to achieve 2 g/hr
     *Antidote: Calcium Gluconate: 10 ml of 10% dilution administered over 3 minutes.

2. Lower BP
   - Start Antihypertensives
     - Goal: Diastolic BP 90 - 110 mm Hg

3. Move towards Delivery
   - Cesarean if:
     - Repetitive Seizures
     - Other emergency
     - Fetal Bradycardia or other sign of fetal hypoxemia
     - Unfavorable Cervix
     - Severe Prematurity

Severe Preeclampsia = Preeclampsia (BP ≥ 140/90 with proteinuria) PLUS ONE of the following:
- Diastolic BP > 110 mm Hg
- Systolic ≥ 160 mm Hg
- Proteinuria more than 3+
- Oliguria
- Lab Changes
  - Liver function test elevation, hemolysis, thrombocytopenia, elevated creatinine
- No oral intake
- Bedrest, left lateral
- VS, reflexes, monitor for symptoms and urine output (Foley)
- Fetal Heart Rate every 30 minutes or more frequently as needed
- Never leave the woman alone

Preferred Options
- Hidralazine: 5 mg IV, continue with 5-10 mg every 20 minutes. Maximum dose: 30 mg
- Labetalol: 20 mg IV, every 10 minutes. Maximum dose: 220 mg

Oral Options
- Nifedipine: 10 mg PO, every 30 minutes. Maximum dose: 50 mg
- Alfa-metildopa (Aldomet): 250 - 500 mg IV every 8 hrs, Maximum dose: 1 g every 6 hrs
Appendix 16: Eclampsia

Eclampsia

Perform Basic Emergency Care

Magnesium Sulfate

**Loading:**
4 - 6g IV (4-6 ampules) in 500 ml of physiologic solution in 15 minutes.

**Maintenance Dose:**
Place 10g (10 ampules) in 500 ml of physiologic solution, and administer at 100ml/hr, for a total of 2g/hour

*Antidote: Calcium Gluconate: 10 ml of 10% dilution administered over 3 minutes.*

Diazepam
If the patient continues to seize or if you do not have Magnesium Sulfate.
10 mg IV slowly over 2 minutes

Stabilize

Transfer to interrupt the pregnancy
If there is no Intensive Care Unit in your hospital

Management during a Seizure:
- Assemble Materials: intubation, suction, bag and mask, oxygen
- Oxygen (4–6 L/ min).
- Protect the woman
- Position on left lateral side
- After the seizure stops, suction her mouth and throat

Management After a Seizure:
- Start IV infusion
- Foley catheter
- Continue Mag Sulfate
- Antihypertensives (if the diastolic > 110 mmHg)
- Stay with the woman

- Every 15 minutes
  - Vital Signs
  - Reflexes
  - FHR
  - Monitor fluid input
  - Urine output
